

Private EA Compliance & Risk-Control Summary

For prop firm, broker, and platform compliance review

Prepared for review by compliance, risk, or trader-support teams

This document summarizes the classification, safeguards, and operational controls of a private MT5 Expert Advisor.

Owner / Trader

Osamwonyi Eric Jesusemwen

System: CCT_EA_v7 private trading automation

Document date: 29 April 2026

Executive Summary

This document provides a generic compliance and risk-control disclosure for CCT_EA_v7, a private Expert Advisor currently implemented for MetaTrader 5. It is intended to accompany an email or support-ticket request where a prop firm, broker, or trading platform asks for a declaration before allowing automated trading.

Plain-language classification

CCT_EA_v7 is a private first-party automation of the trader's own rule-based trading process. It is not a purchased public bot, signal copier, grid, martingale, latency arbitrage, HFT, reverse-trading, or news-straddling system.

Owner / trader	Osamwonyi Eric Jesusemwen
Current platform	MetaTrader 5 Expert Advisor. Future ports to other platforms should be separately documented.
Strategy family	Private CCT / Candle Continuation Theory trading model with POI, session, validation, execution, and risk-management rules.
Primary purpose	Automate mechanical execution and risk management of a proprietary rule-based trading model.
Disclosure scope	Summary of system type, safeguards, and operational intent. It does not disclose source code or confidential model internals.

Classification Statement

- The EA is built for first-party use by the owner/trader, not for resale, mass distribution, account management, or third-party signal provision.
- The EA automates rule-based entries, position sizing, stop-loss placement, take-profit placement, break-even logic, and optional account-protection rules.
- The trading model was designed and supervised by the owner. Coding was assisted by software/AI tools, but the strategy rules and risk parameters remain the owner's responsibility.
- The EA can be configured to comply with firm-specific limits such as daily drawdown, max exposure, restricted news windows, weekend controls, and maximum risk per trade.

System Scope and Trading Behavior

The system is intended to operate only when its predefined trading conditions are satisfied. It is not designed to exploit broker latency, price-feed anomalies, platform errors, or prohibited trade-copying structures.

Area	Disclosure
Entry logic	The EA looks for predefined structural conditions within the owner's CCT model, including POI births, correction/continuation validation, session timing, and model-specific confirmation rules.
Risk sizing	Risk is intended to be fixed by configuration and should round down rather than exceed the selected risk percentage or max-lot constraints.
Trade management	The EA may manage stop loss, take profit, break-even, and optional protective exits according to configured rules.
Session filters	The EA can be restricted by execution hours and session rules, including New York-session logic where applicable.
News behavior	The EA can be configured to avoid new entries and optional trade modifications during a restricted news window, where supported by the platform/data source.
Weekend behavior	Optional weekend protection can block new trades and close EA-managed positions before a configured market-close cutoff.

Explicit Non-Use Statement

System type	Status
Grid / martingale	Not used. The system is not designed to multiply position size after losses or average indefinitely.
Signal copying / account copying	Not part of the EA's core function. Any copying would require separate permission if a firm restricts it.
Latency arbitrage / HFT	Not used. The model is candle/structure driven, not latency driven.
News straddling	Not intended. The EA can be configured to block entries around restricted news events.
Reverse trading / hedging abuse	Not intended. The EA is designed for direct execution of one private model, not mirrored-account exploitation.
Public or purchased EA	Not applicable. This is a private EA built for the owner's own strategy.

Risk Controls and Compliance Configuration

The EA is intended to be configurable so that the trader can adapt it to a firm's published rules. The items below are suitable for compliance review and should be checked against the specific firm's current rulebook before use.

Recommended operating principle

For funded or instant-funded accounts, the EA should fail conservative: if a rule check is unavailable, ambiguous, or breached, the EA should avoid opening a new trade and should journal the reason.

Control	Purpose	Typical setting
Fixed risk per trade	Limits risk to a configured percent or fixed amount per position.	0.25% to 1.00% depending on firm rules.
Daily loss guard	Stops new trades when realized plus floating daily loss reaches a configured limit.	Firm-specific daily drawdown threshold.
Max exposure guard	Prevents excessive aggregate exposure from one symbol or account.	Firm-specific max exposure or lot cap.
News blackout	Blocks new trades, and optionally blocks EA-side modifications, around restricted news.	Example: 5 minutes before and 5 minutes after.
Weekend protection	Blocks new trades near weekend close and can close EA-managed positions before a cutoff.	Optional, depending on firm weekend policy.
Minimum profitable hold time	Optionally delays TP/profit exits where a firm discourages ultra-short profitable closures.	Optional; must not delay SL or emergency closes.
Trade comments	Provides compact audit information without exposing sensitive model internals.	Example: CCT NY 07:00 CCT+TS.

Operational Responsibilities

- The trader remains responsible for enabling only those settings that comply with the active account's rules.
- The trader should run demo or strategy-tester checks before using the EA on a funded or instant-funded account.
- The trader should monitor live execution, broker slippage, spreads, market closures, and data-quality differences.
- If a prop firm requires an EA add-on, VPS add-on, or written approval, the trader should obtain that confirmation before use.

Audit Trail, Confidentiality, and Approval Request

This document is designed to provide enough information for a compliance review while avoiding disclosure of private strategy source code or proprietary model details.

Item	Disclosure approach
Source code	Not attached by default. The EA is private intellectual property. A firm may request further clarification, screenshots, logs, or a controlled demonstration if needed.
Trade comments	The EA can include compact model and time information in broker comments without exposing POI serials or sensitive internals.
Tester / journal logs	Internal logs may include more detailed audit fields such as model type, NY time, entry, SL, TP, outcome, and rejection reasons.
Versioning	The EA should be versioned and backed up before funded use. Material changes should be retested before deployment.
VPS use	If a VPS is used, it is intended only for stable execution and monitoring, not latency arbitrage.

Suggested compliance confirmation request

- Confirm that private first-party MT5 EA automation is allowed on the account.
- Confirm whether an EA add-on, VPS add-on, or prior written approval is required.
- Confirm any restrictions on copying between the trader's own accounts.
- Confirm any max allocation, duplicate-strategy, or same-strategy restrictions.
- Confirm any special news, weekend, minimum-duration, or prohibited-strategy rules that the EA must enforce.

Trader declaration

I, Osamwonyi Eric Jesusemwen, confirm that CCT_EA_v7 is a private automation of my own trading system. I remain responsible for all configuration, monitoring, and trade outcomes. I will configure the EA to comply with the account provider's rules before live/funded use.
